AMENDMENTS TO THE CLAIMS

1-30. (Canceled)

31. (Previously Presented) A mobile computing device, comprising:

a position-determining component configured to determine a position of the mobile computing device relative to time;

a user input component configured to receive a user selection of a type of information; and

a communication component configured to transmit first Internet data over a wireless connection to a server computing device storing position-related information and to receive second Internet data over the wireless connection from the server computing device; wherein the first Internet data includes the geographical position of the mobile computing device and the user selection of a type of information and the second Internet data includes data selected in response to the user selection and the geographical position of the mobile computing device; and

an information reporting component configured to report the received selected data to the user.

32. (Previously Presented) The mobile computing device of claim 31 wherein the position-determining component includes a GPS receiver configured to indicate a position of the GPS receiver on the Earth's surface, and the first Internet data further includes a rate of change of position or a direction of change of position of the mobile computing device.

33. (Previously Presented) The mobile computing device of claim 31 wherein the second Internet data includes site-to-site data in relation to dynamic position of the mobile computing device.

34. (Previously Presented) The mobile computing device of claim 31 wherein the communication component is further configured to receive over the wireless connection pushed real-time data in relation to the geographical position of the mobile computing device.

35. (Previously Presented) The mobile computing device of claim 31 wherein the information reporting component is further configured to report the received selected data audibly.

36. (Previously Presented) The mobile computing device of claim 31 wherein the information reporting component is further configured to report the received selected data visually.

37. (Currently Amended) The mobile computing device of claim 31 wherein the user selection of the type of information relates to businesses or services. [[f]]

38-50. (Canceled)

51. (Previously Presented) A communication system, comprising:

a server configured to receive first Internet data from a base station, the first Internet data including a geographical position of a mobile computing device and a user selection of a type of information transmitted to the base station from the mobile computing device over a wireless connection; and

the server further configured to select data responsive to the user selection and the geographical position from a database and to send the selected data as second Internet data to the base station.

52. (Previously Presented) The communication system of claim 51, furthering comprising the base station, wherein the base station is further configured to transmit the second Internet data to the mobile computing device over the wireless connection.

53. (Previously Presented) The system of claim 51, wherein the server is further configured to push real-time data to the mobile computing device in relation to the geographical position of the mobile computing device.

54. (Previously Presented) The system of claim 51, wherein the server is further configured to select data based on a rate of change of position of the mobile computing device.

55. (Previously Presented) The system of claim 51, wherein the server is further configured to select data based on a direction of change of position of the mobile computing device.

56. (Previously Presented) The system of claim 51, wherein the second Internet data includes site-to-site data in relation to dynamic position of the mobile computing device.

57. (Previously Presented) The system of claim 51, wherein the user selection of the type of information relates to businesses or services.

58. (Currently Amended) A method peformed by a computing system having a processor and memory, comprising:

receiving by the computing system first Internet data from a base station, the first Internet data including a geographical position of a mobile computing device and a user selection of a type of information transmitted to the base station from the mobile computing device over a wireless connection;

selecting data responsive to the user selection and the geographical position from a database; and

sending the selected data as second Internet data to the base station.

59. (Previously Presented) The method of claim 57, further comprising transmitting the second Internet data from the base station to the mobile computing device over the wireless connection.

60. (Previously Presented) The method of claim 57, further comprising pushing real-time data to the mobile computing device in relation to the geographical position of the mobile computing device.

61. (Previously Presented) The method of claim 57, further comprising selecting data based on a rate of change of position of the mobile computing device.

62. (Previously Presented) The method of claim 57, further comprising selecting data based on a direction of change of position of the mobile computing device.

63. (Previously Presented) The method of claim 57, wherein the second Internet data includes site-to-site data in relation to dynamic position of the mobile computing device.

64. (Previously Presented) The method of claim 57, wherein the user selection of the type of information relates to businesses or services.

65. (Previously Presented) A communication system, comprising:

a base station configured to receive first Internet data over a wireless connection from a mobile computing device, wherein the first Internet data including a geographical position of the mobile computing device and a user selection of a type of information; and

a server configured to receive the first Internet data from the base station and to select data responsive to the user selection and the geographical position from a database, and the server further configured to send the selected data as second Internet data,

wherein the base station is further configured to transmit the second Internet data to the mobile computing device over the wireless connection.

66. (Previously Presented) The communication system of claim 65, wherein the server is further configured to push real-time data to the mobile computing device in relation to the geographical position of the mobile computing device.
